

Amendments to the Claims

Kindly amend claims 1, 16 & 31 as set forth below. The changes in the amended claims are shown by strikethrough (for deleted matter) and underlining (for added matter).

1. (Currently Amended) A method of reducing data movement within a computing environment, said method comprising:

C) transmitting data between a file system of a server of said computing environment and a transmission medium of said computing environment, said transmitting being responsive to a request for transmission received by the server, wherein said server includes at least one file system buffer and at least one server buffer, said at least one server buffer residing outside the file system of the server, ~~non-file system buffer, and~~

wherein said transmitting comprises at least one of:

receiving said data by said file system from a sender, said receiving comprising swapping one or more buffers of the at least one file system buffer with said one or more buffers of the at least one server buffer; and *received first where the buffer or server buffer*

sending said data from said file system over said transmission medium to a receiver of said data, said sending comprising executing, by the file system, a callback function referenced by said request to send said data directly over the transmission medium from the one or more buffers of the at least one file system buffer, and *or server buffer*

wherein said swapping and said executing the callback function facilitate ~~wherein said transmitting comprises transmitting data directly between the transmission medium and one or more buffers of the at least one file system buffer,~~ *but swapped buffer* thereby reducing data movement in said server by bypassing copying the data between one or more buffers of the at least one server ~~non-file system~~ buffer and the one or more buffers of the at least one file system buffer in performing the

transmission, said copying the data being bypassed without the server having advance notice of a pattern of access of the data in the file system. ~~irrespective of the server having knowledge of the request prior to receipt thereof.~~

2. (Original) The method of claim 1, wherein said transmitting comprises sending data from a sender of said computing environment over said transmission medium to said file system to be written to one or more storage media coupled to said file system.

16. (Currently Amended) A system of reducing data movement within a computing environment, said system comprising:

C/ means for transmitting data between a file system of a server of said computing environment and a transmission medium of said computing environment, said transmitting being responsive to a request for transmission received by the server, wherein said server includes at least one file system buffer and at least one server buffer, said at least one server buffer residing outside the file system of the server, non-file system buffer, and

wherein said means for transmitting comprises at least one of:

means for receiving said data by said file system from a sender, said means for receiving comprising means for swapping one or more buffers of the at least one file system buffer with said one or more buffers of the at least one server buffer; and

means for sending said data from said file system over said transmission medium to a receiver of said data, said means for sending comprising means for executing, by the file system, a callback function referenced by said request to send said data directly over the transmission medium from the one or more buffers of the at least one file system buffer, and

C/ wherein said means for swapping and said means for executing the callback function facilitate ~~wherein said means for transmitting comprises means for transmitting data directly between the transmission medium and one or more buffers of the at least one file system buffer, thereby~~ reducing data movement in said server by bypassing copying the data between one or more buffers of the at least one server non-file system buffer and the one or more buffers of the at least one file system buffer in performing the transmission, said copying the data being bypassed without the server having advance notice of a pattern of access of the data in the file system. ~~irrespective of the server having knowledge of the request prior to receipt thereof.~~

17. (Original) The system of claim 16, wherein said means for transmitting comprises means for sending data from a sender of said computing environment over said transmission medium to said file system to be written to one or more storage media coupled to said file system.

31. (Currently Amended) At least one program storage device readable by a machine, tangibly embodying at least one program of instructions executable by the machine to perform a method of reducing data movement within a computing environment, said method comprising:

transmitting data between a file system of a server of said computing environment and a transmission medium of said computing environment, said transmitting being responsive to a request for transmission received by the server, wherein said server includes at least one file system buffer and at least one server buffer, said at least one server buffer residing outside the file system of the server, ~~non-file system buffer~~, and

wherein said transmitting comprises at least one of:

receiving said data by said file system from a sender, said receiving comprising swapping one or more buffers of the at least one file system buffer with said one or more buffers of the at least one server buffer; and

sending said data from said file system over said transmission medium to a receiver of said data, said sending comprising executing, by the file system, a callback function referenced by said request to send said data directly over the transmission medium from the one or more buffers of the at least one file system buffer, and

wherein said swapping and said executing the callback function facilitate
~~wherein said transmitting comprises transmitting data directly between the transmission medium and one or more buffers of the at least one file system buffer, thereby reducing data movement in said server by bypassing copying the data between one or more buffers of the at least one server non-file system buffer and the one or more buffers of the at least one file system buffer in performing the transmission, said copying the data being bypassed without the server having advance notice of a pattern of access of data in the file system, irrespective of the server having knowledge of the request prior to receipt thereof.~~

32. (Original) The at least one program storage device of claim 31, wherein said transmitting comprises sending data from a sender of said computing environment over said transmission medium to said file system to be written to one or more storage media coupled to said file system.
